Talagtag, Timothy A.   **Web Development**

BSIT-3A   **Exercise No. 1**

1.html – Password and Box Control

- The text box lets you type and see what you write. The password box only show dots and sometimes asterisks to hide what you typed for privacy.

2.html – Check Boxes

- Checkboxes let you choose one option or more. You can tick one, many, or all of them.

3.html – Option Buttons (Radio Buttons)

- Radio buttons only let you pick one choice. If you pick another, the first one you picked will be unselected and replaced by the new option you have selected.

4.html – Text Area Controls

- The textarea is a bigger box where you can type many lines. It's good for longer input of words, answers, or comments.

5.html – OPTGROUP Tag

- The OPTGROUP groups items in a dropdown list. It helps make the choices more organized and easy to see.

6.html – FIELDSET and LEGEND Tags

- The FIELDSET puts a box around form items to group them. The LEGEND shows a title for that group.

7.html – Submit Query and Reset Buttons

- The Submit button sends your answers in the form. The Reset button clears everything you typed.
